SCT v2.2-E Integrated Public Mini-Release

Centerless timeline-bundle wording addendum

Release decision. SCT_V2_2_E_INTEGRATED_PUBLIC_MINI_RELEASE_TIMELINE_BUNDLE_DONE.

This mini-release integrates v2.2-B, v2.2-C, and v2.2-D into one compact public addendum. It is a semantic/public-framing correction for SCT, not a new physical model.

1. Core clarification

Item	Clarification
Object clarified	The bundle of modeled temporal lines, not the physical geometry of the universe.
Big Bang marker	Common boundary condition for modeled temporal lines, not a spatial center.
Circular/spherical layers	Nonphysical visualization of unfolding/phase/accessibility/capacity/model scale.
Legacy right-edge intuition	Deprecated for public framing because it can suggest a privileged side or edge.
Legacy auxiliary sphere	Allowed only as diagrammatic convention with explicit centerless timeline-bundle language.

Safe public summary:

SCT models or visualizes a centerless bundle of temporal lines born from a common Big-Bang boundary condition. Circular or spherical drawings are nonphysical visualization tools; they are not a claim of a spatial center, a privileged edge, a material shell structure, or a literal spherical universe.

2. Integrated lineage

Stage	Role
v2.2-B	Narrowed the reformulation: timeline-bundle object, not physical universe geometry.
v2.2-C	Scanned public text and identified ambiguity around auxiliary sphere / common point language.
v2.2-D	Converted the semantic standard into Zenodo/GitHub/README copy-paste blocks.
v2.2-E	Integrates B/C/D into one public mini-release with hashes, QA, and patch blocks.

3. Claim boundary

- No new numerical execution.
- No v2.0/v2.1 transfer-kernel result changed.
- No observational prediction or measured cosmological parameter added.
- No claim of complete physical cosmology.
- No spatial Big-Bang center or literal spherical universe claim.
- No claim that all modeled temporal lines physically exist.

4. Public copy blocks included

The package includes normalized v2.2-E versions of the public blocks prepared in v2.2-D:

- copy_paste_blocks/AUXILIARY_TIMELINE_BUNDLE_REPLACEMENT_EN_v2_2_E.md

- copy_paste_blocks/GITHUB_README_NOTICE_BLOCK_v2_2_E.md

- copy_paste_blocks/LONG_PUBLIC_NOTE_v2_2_E.md

- copy_paste_blocks/SEZIONE_SOSTITUTIVA_BUNDLE_LINEE_TEMPORALI_IT_v2_2_E.md

- copy_paste_blocks/SHORT_PUBLIC_DISCLAIMER_v2_2_E.md

- copy_paste_blocks/ZENODO_DESCRIPTION_BLOCK_v2_2_E.md

Recommended use order:

- Add the Zenodo description block to the public record or a new addendum record.

- Add the GitHub README notice block near the top of the repository.

- Replace or annotate legacy auxiliary sphere / common point passages using the EN/IT replacement section.

- Keep all numerical transfer-kernel results unchanged.

5. Minimal replacement section

```
B(sigma) = { L_i(sigma) }
```

Here L_i is a modeled temporal line and sigma is a nonphysical unfolding, phase, accessibility, capacity, or model-dependent scale parameter unless an explicit toy-model mapping states otherwise.

The common graphical marker denotes the Big-Bang boundary condition shared by the modeled temporal lines. It is not a spatial center, not a spacetime location inside a pre-existing space, and not a privileged edge of the universe.

6. Input hashes

Input	SHA256

7. Package QA and next step

This package is expected to be used as a compact public mini-release. It intentionally avoids re-running numerical work or changing the v2.0/v2.1 transfer-kernel result lineage.

Recommended next step. v2.2-F final upload bundle, only if needed: create a flat upload set with v2.2-E PDF/ZIP, sidecar hashes, selected v2.1-H files, and a short Zenodo/GitHub release checklist. Avoid nested ZIPs unless there is a clear archival reason.

Decision record.
