SCT v2.2-H - Final Upload Clarification Patch

Purpose

This patch addresses final publication-review refinements after v2.2-G. It is not a new computational release and does not alter the v2.1.0/v2.1-H public artifacts, formulas, tables, scripts, or transfer-kernel conclusions.

Decision

`SCT_V2_2_H_FINAL_UPLOAD_CLARIFICATION_PATCH_DONE`

Review reservations addressed

- **v2.1-H QA-only note visibility:** Created Zenodo/GitHub upload wording that states the known qa/final_zip_test.txt manifest mismatch and its non-impact on results.
- **Version semantics:** Public copy now states: wording clarification plus numerical/formula invariance audit; no new numerical result.
- **B(sigma) notation role:** Added note: B(sigma)={L_i(sigma)} is descriptive only, not a dynamical equation or computational input.
- **Hardcoded audit paths:** Added a path-configurable portable audit template for future reruns; the original v2.2-F executed audit remains authoritative.

Public wording lock

v2.2 should be described as a clarification and audit layer: it adds a centerless timeline-bundle wording patch and a numerical/formula invariance audit. It does not add new numerical results, observational evidence, physical cosmology claims, or changes to the v2.1.0 transfer-kernel conclusions.

Known QA-only packaging note

The archived v2.1-H package preserves a documented manifest mismatch on qa/final_zip_test.txt. This is a packaging/QA-file issue only and does not affect formulas, scripts, tables, numerical outputs, PDFs, or scientific results. v2.2-F documented the issue; v2.2-H makes it visible in upload-facing copy.

B(sigma) note

`B(sigma) = {L_i(sigma)}` is descriptive only. It denotes a schematic collection of modeled timeline states at an abstract bundle parameter. It is not a new field, not a new equation, not a computational input, and not a claim that all modeled temporal lines physically exist.

Path-portability patch

The executed v2.2-F audit remains the authoritative audit because it contains the actual logs and hashes. v2.2-H adds a portable script template so future reruns can supply roots through CLI arguments rather than hardcoded /mnt/data paths.

No-change boundary

- No new numerical execution.
- No formula or derivation changed.
- No transfer-kernel result changed.
- No observational claim.
- No modification to v2.1-H archived/public files.
- No widening of claim boundary.
